

## Questions and answers about Troforte M natural mineral fertiliser.

### **Is Troforte M All purpose suitable for all my garden?**

You can use it your pot plants, fruit trees, vegetable garden, shrubs and trees. In fact Troforte M is suitable for the whole garden. A 10kg bucket is usually sufficient for a whole garden, for 4 months. There is a special mini chip product for lawns (Fert O Lawn), but if you have a small garden, you can use Troforte M all Purpose on your lawn too.

### **Why is Fert O Lawn better for lawns?**

It is a micro sized granule/chip and therefore it falls easily thru the grass, onto the soil below. Its breaks up quite quickly after watering in. Therefore it is not picked up by the mower.

### **Does this fertiliser have any smell?**

Answer:

Only a very slight smell when in the container. No smell after application.

### **Is it Pet safe?**

Pets are not attracted to Troforte M. It's river and reef safe too!

### **How long can I store it?**

Answer: The product may last for years but we recommend use within 11 months of purchase.

### **Looks like the commercial granule in 20kg bags is different in appearance to the 10kg home garden granule?**

Answer: yes, the 10kg home garden pack has a different construction to give a bit faster early release and therefore you will see quicker results. Both products have the same analysis.

### **Will the product really feed a garden for four months?**

Answer: Yes, in fact it may last for 5-6 months but we recommend you re apply after 4 months.

**Is this product organic?**

Answer: Its not organic, its natural minerals +beneficial microbes &fungi. It also contains some slow release nutrients as well to feed the microbes. It's very safe for the environment , it's river and reef safe. You can read more about this in detail in the data on this product on this website.

Our approach: feed the Microbes, feed the soil, then feed the plants.

**Is this product safe to handle ?**

Answer: It's fine to handle it with your hands but we do provide a scoop in the bucket to measure and control application rates. Do not place your wet , sweaty hands in the bucket if you intend to store the product. Moisture is the trigger to wake up the microbes.

**Where do the beneficial microbes and fungi come from?**

They are all naturally occurring Australian species. Your soil is a living structure. Earthworms and Microbes are necessary for a healthy soil. Droughts and the use of chemical fertilisers and Fungicides reduces and even kills microbe and earthworm populations.

**Is this product better than organic fertilisers?**

There is nothing wrong with using organic fertilisers. But Troforte M provides a very much better level and delivery of nutrients than can be obtained from organics. You can continue to use organics along with Troforte M as both kinds of products work in harmony.

**Importantly**, this product is not made from the by-products of animals that have been slaughtered, nor is it made from the waste of animals that have been farmed in constricted environments.

**How about liquid organics? How do they compare?**

Liquid organics are a useful **supplement**. It's a cheap way to top up your feeding program. It does not replace the use of solid fertilisers. You can continue to use liquid organics along with Troforte M
